Revit Transition & Drafting Pilot — Proposal for a2o Architecture

Oct 13, 2026 · @Nick

Prepared by Keys2TheWeb for a2o Architecture, Key West. a2o is moving from AutoCAD LT to Revit. This proposal covers Keys2TheWeb's role in that transition: taking load off the team during the changeover, carrying a2o's drafting standards cleanly into Revit, and — once the firm is working in Revit — building custom automation for whatever Revit doesn't handle on its own.

The situation

a2o is making the move from AutoCAD LT to Revit. Today the team drafts in LT — flat 2D, every sheet drawn and annotated by hand. Revit changes that: the building is modeled once, and plans, sections, elevations, schedules, and sheets come from the model.

That shift is the right moment to tighten two things that pay off immediately and carry straight into Revit — a2o's drafting standards, and the repetitive note, spec, and schedule work that eats project hours. It's also where custom automation, Keys2TheWeb's core work, has its opening: once the team is modeling in Revit, the gaps Revit leaves for a2o's specific work become clear and worth building for.

The approach

Keys2TheWeb's work wraps around a2o's Revit rollout in three moves.

Relief during the changeover. Standardize a2o's current 2D kit and stand up an AI note/spec/schedule helper the team can use right now — work that takes pressure off today and feeds straight into the Revit templates.

Standards that carry over. As Revit comes online, encode a2o's drafting standards into the templates so every project inherits them, keeping the firm's conventions consistent from LT through Revit.

Automation where Revit falls short. Once a2o is working in Revit, document what it still doesn't do well for the firm's specific work and build custom tooling for exactly those gaps — Keys2TheWeb's core strength, scoped from evidence rather than a guess.

Scope

Phase 0 — Interim relief, during the changeover (Keys2TheWeb).

- Standardize a2o's current 2D kit — title blocks, blocks/library, layer and annotation standards — taking friction out of today's drafting and feeding straight into the Revit templates
- An AI note/spec/schedule helper that drafts general notes, spec sections, and schedules as text the team drops in (works alongside LT, carries into Revit)
- To be clear: this does not automate inside AutoCAD LT — that tier can't be extended — it's relief *around* it, built so none of the work is wasted when Revit lands

Phase 1 — Standards & rollout coordination (Keys2TheWeb).

- Encode a2o's drafting standards into the new Revit templates — layers/line styles, annotation, dimensioning, title blocks
- AI-drafted standards documentation so the whole team works the same way
- Coordinate the rollout: timeline, checkpoints, and keeping standards consistent from LT through Revit

The Revit setup itself — building the project templates and family library, and training the team — is a2o's own track, handled in-house, with a Revit specialist, or through Autodesk's onboarding. It isn't priced in this proposal. Keys2TheWeb can work alongside that effort on the implementation if a2o wants the help.

Phase 2 — Automation assessment, optional (Keys2TheWeb).

- With a real project behind them, document what Revit handles well and what it doesn't for a2o's work
- Identify the gaps worth a custom tool (if any), and quote that build from evidence
- This is where the original "drafting robot" idea gets a real, grounded scope

Not included: the architect's review and stamp — Revit and any later tool produce drafts; a2o's licensed architect reviews and signs. Autodesk license fees are paid by a2o directly (see Investment).

Investment

This covers Keys2TheWeb's scope only. Two other costs sit outside it: a2o's **Autodesk subscription** (paid directly to Autodesk), and the core **Revit setup and training**, which is a2o's own track — in-house, a Revit specialist, or Autodesk's onboarding. Keys2TheWeb

can assist with that implementation if wanted, quoted separately at that point.

Item	What it covers	Investment
Phase 0 — Interim relief (start now)	Standardize the 2D kit (feeds Revit); AI note/spec/schedule helper	**$3,000** flat
Phase 1 — Standards & coordination	Encode a2o's standards into the Revit templates; AI-drafted standards docs; coordinate the rollout	**$1,500–$2,500**
Phase 2 — Automation assessment	Document Revit gaps; scope and quote a custom tool	**$2,500** fixed
Care plan	Tooling and standards upkeep, support once live	**From $300 / month**

a2o's Revit subscription is contracted and paid directly to Autodesk — roughly $3,005/year per seat for Revit, or $3,675/year for the AEC Collection (confirm current pricing with Autodesk). Keys2TheWeb's fees above are separate from the subscription.

Why phased: this sequence spends money on the foundation that actually unlocks a2o's goal, proves it on a real project, and only then prices custom automation — against evidence instead of a guess. a2o can stop after any phase with a working result in hand.

Payment: Phase 0 is a flat **$3,000**, invoiced to begin — it can start as soon as a2o gives the go-ahead. a2o moves to Phase 1 whenever they're ready; each later phase is 50% deposit / 50% on delivery, and the care plan is billed monthly.

Timeline

Rough pacing for Keys2TheWeb's phases. Phase 0 can start immediately; Phase 1 runs alongside a2o's Revit rollout; Phase 2 follows once a real project has been through Revit.

Milestone	What happens	Timing
Phase 0 — Interim relief	Standardize the 2D kit; stand up the AI note/spec helper; overflow drafting as needed	Weeks 1–3, starts now

Milestone	What happens	Timing
Phase 1 — Standards & coordination	Encode a2o's standards into the Revit templates as the setup proceeds	Alongside a2o's Revit rollout
Phase 2 — Automation assessment	After a real Revit project, document the gaps and quote any custom tool	After the rollout

Terms & next steps

Assumptions

- The core Revit setup and training is a2o's own track — in-house, a Revit specialist, or Autodesk's onboarding. Keys2TheWeb can work alongside it on the implementation if a2o wants the help.
- Revit and any later tool produce drafts; a2o's licensed architect reviews and stamps all output.
- Phase 2 (and any custom automation) is scoped and priced after a real Revit project, from what Revit actually leaves undone.
- Autodesk subscriptions are contracted and paid by a2o directly.

What Keys2TheWeb needs to start

1. a2o's current drafting standards and 2–3 typical past projects, to work from
2. Go-ahead on Phase 0 and the $3,000 invoice

To accept: a2o approves Phase 0, and Keys2TheWeb sends the kickoff scope and the invoice. Phase 0 can begin right away, and a2o moves to Phase 1 whenever they're ready.
